

Pointing your domain at the new site.

About 10 minutes in Wix. You are changing where your web address sends people — nothing gets deleted, and you keep the domain.

Mac's part is done — you're clear to go.

GitHub is already expecting `musicatedrecords.com`. Nothing else needs doing first. Work through the steps below in order.

What you're actually doing

Right now `musicatedrecords.com` sends people to your old Wix site. You're changing two things — the **A records** and the **www record** — so it sends them to the new one instead. You still own the domain, you still pay Wix for it, and your Wix account carries on exactly as before.

The steps

- 1 Log in to **Wix**. Top right, go to **Domains**.
- 2 Next to `musicatedrecords.com`, click the **Domain Actions** icon (the three dots), then **Manage DNS Records**.
- 3 Find the section headed **A (Host)**. There are **three rows**, each pointing at an address starting `185.230.63.` — **delete all three**.
- 4 Still in **A (Host)**, add **four new rows** from the table below. Host is `@` every time, TTL is **1 hour** every time. Only the address changes.
- 5 Find the section headed **CNAME (Aliases)**. Find the row where Host is `www` — its value currently says `cdn1.wixdns.net`. Change that value to:
`brucemacvaughn.github.io`
- 6 **Save**. Then close the tab and go and do something else — see below.

The four addresses to add

HOST	POINTS TO	TTL
@	185.199.108.153	1 hour
@	185.199.109.153	1 hour
@	185.199.110.153	1 hour
@	185.199.111.153	1 hour

They are almost identical — only the third number changes: **108, 109, 110, 111**. Getting one digit wrong is the most common mistake, so check them twice before you save.

Only touch those two sections

Change the **A (Host)** rows and the single **www** row under CNAME. If you see any other records, leave them exactly as they are. Don't delete anything you weren't told to delete.

If Wix won't let you delete the A records

It may say the domain is connected to your Wix site. If so, find **Disconnect** (or **Change connection method**) on the domain first, then come back to Manage DNS Records. If you can't find it, stop and message Mac rather than clicking around.

Then wait — this bit is normal

The change has to spread across the internet. Usually under an hour, occasionally up to **48 hours**. During that time the old site may still appear, and it may appear for you but not for someone else. That is expected and it is not broken.

Checking it worked

Open `musicatedrecords.com` on your **phone, on mobile data** — not wifi. That's the quickest honest test; your laptop remembers the old address for a while and will lie to you. When you see the black site with the spinning record, it's done.

Two last things

Tell Mac when it's live. There's one final switch he has to flip on GitHub — the padlock, so the site loads as `https://`. It can't be turned on until the domain is pointing correctly, so it's the last job, not the first.

Your email is safe. The domain has no email records on it at all, so there is nothing here that can break an inbox.

Do not cancel or transfer the domain

Keep paying Wix for it as normal. You're only changing where it points, not who owns it. Cancelling it would take the site down.

If something looks wrong

Message Mac — don't try to undo it yourself. Everything here is reversible in a couple of minutes if he knows exactly what changed. Tell him what you clicked and he'll sort it.
